

## Geofluid 2023

Big news at Geofluid, scheduled for Sept. 13-16, 2023, in Piacenza.

An exhibition area dedicated to **contaminated site remediation activities** and technologies related to **environmental protection** works opens. This is a sector of strong interest that is fully part of the ecological transition under way at the European level. In Hall 3, therefore, the many technical and engineering firms involved in remediation or reconversion interventions, manufacturers and distributors of machines for surveys, analysis and subsurface investigations as well as equipment for environmental restoration and testing will find a fair exhibition opportunity.

Another novelty of sure impact for the ten thousand professionals who will visit Geofluid 2023 is the space that Piacenza Expo will reserve for **exhibitors' live demos**. A real construction site next to the exhibition center will host innovations and operational protocols thanks also to the collaboration of the Emilia-Romagna Order of Geologists. Field trials combined with technical seminars will complete the professional update offer for companies and professionals.

The most important international exhibition event for the **drilling&foundations sector** finds new stimuli from the precise historical moment related to international economic situations. Geofluid takes place in a period of great ferment on the front of environmental public works and consequent investments.

In fact, PNRR funds are structured consistently with the European Green Deal. The planned interventions target investment and research programs for renewable energy sources, initiatives to combat hydrogeological instability, efficient use of water and improvement of inland water quality. The Plan devotes substantial resources to land safety, understood as the mitigation of hydrogeological hazards (with prevention and restoration interventions), the elimination of water and land pollution, and the availability of water resources such as primary infrastructure and purification.

The new work vehicles, equipment and technologies already available for shipbuilding will be the added value of the event, which has the certified status of "international exhibition" for the period conducive to business investment.

**Geofluid 2023** aspires to reconfirm the numbers of the last edition with 280 direct exhibitors and ten thousand professional visitors from more than 50 foreign countries.
